

CMC SPACEY GROUP JSC.

SPACE TECHNOLOGY GROUP
SATELLITES - DATA - AI - DIGITAL FINANCE

UNLOCKING THE POTENTIAL OF SPACE

A new-generation space technology enterprise
100% Vietnamese-owned
Oriented to become a leading regional group

COMPANY PROFILE

MESSAGE FROM THE CHAIRMAN

CMC SpaceY Group JSC. is a new-generation space technology enterprise of Vietnam, oriented to develop into a 100% Vietnamese-owned group operating in the fields of research, development, application, and the gradual mastery of satellite technology, remote sensing data, artificial intelligence (AI), space data infrastructure, digital platforms, and value-added services derived from satellite products.

CMC SpaceY Group JSC. was established with the aspiration to participate in the space technology sector, contributing to Vietnam's development of autonomous capabilities in satellite infrastructure, space data, and high-tech applications serving civil use, the digital economy, natural resource management, logistics, maritime services, high-tech agriculture, smart cities, digital finance, and the country's new development needs.

As the world enters the era of the space economy and the digital economy, satellite data, artificial intelligence, digital assets, digital payments, and digital banking are becoming critical infrastructure for growth. CMC SpaceY Group JSC. aims to play a pioneering role for Vietnam in connecting space technology with digital platforms to serve people, businesses, and the economy.

Chu Minh Chien

Chairman of CMC SpaceY Group JSC.

CMC SPACEY
— GROUP JSC. —

VISION & MISSION

**Building a strategic space technology ecosystem for
Vietnam, ASEAN, Africa and Oceania**

VISION & MISSION

VISION 2045

Become Vietnam's leading space technology - satellite - data - AI - digital finance group, gradually expanding into the region and internationally.

Contribute to the formation of a space economy and digital economy ecosystem owned and controlled by Vietnam.

Build autonomous capabilities in satellite infrastructure, space data, and high-tech applications serving civil use, the digital economy, natural resource management, and national development.

TECHNOLOGY MISSION

- Research, receive, develop, and master satellite technology, remote sensing data, and AI.
- Build research, manufacturing, operations, and data processing infrastructure in Vietnam.
- Deploy satellite services serving the digital economy, natural resources, logistics, agriculture, and urban development.
- Develop payment gateways, mobile applications, and digital platforms for the CMC SpaceY ecosystem.
- Train and develop Vietnam's space technology human resources.

CORPORATE POSITIONING

An integrated technology - commerce - data platform connecting satellite products with value-added services

SATELLITES & REMOTE SENSING

Research, manufacture, and master satellite technology and Earth observation data serving socio-economic development.

AI & BIG DATA

Analyze satellite imagery, detect changes, forecast resources, and support data-driven decision-making.

DIGITAL FINANCE

Payment gateways, digital asset exchanges, digital banking, and ecosystem financial services.

SOFTWARE & APPLICATIONS

Mobile apps, specialized social networks, API platforms, and the CMC SpaceY application ecosystem.

KEY FOCUS AREAS

01

Satellite Technology

LEO / MEO / GEO

02

Remote Sensing Data

Earth Observation

03

AI & Big Data

AI & Big Data

04

Space Solar Power

Space Solar Power

05

Digital Assets

Digital Asset Exchange

06

Payment Gateway

Payment Gateway

07

Digital Banking

Digital Banking

08

Software & Apps

Mobile & Social Platform

SATELLITE TECHNOLOGY & REMOTE SENSING DATA

Earth Observation (EO) Satellites

High-resolution multispectral imagery serving natural resource, environmental, and urban management. Supports farming, disaster warnings, and climate change monitoring.

Telecommunications & Connectivity Satellites

Provide coverage for remote and underserved areas, islands, and maritime zones. Provide backup communications infrastructure during disasters and emergencies.

AIS/LEO Remote Sensing Satellites

Track vessels, monitor territorial waters, and support 24/7 maritime safety. Detect illegal vessels and manage maritime transport flows.

LEO / MEO / GEO Orientation

Build a multi-orbit satellite constellation, from 160-1,300 km up to 35,786 km. The objective is for Vietnam to own and operate its own satellites.

ARTIFICIAL INTELLIGENCE (AI) & BIG DATA

Apply AI and Big Data across the entire space data value chain - from acquisition and storage to commercialization.

SATELLITE IMAGE ANALYSIS

Object detection, surface change detection, and automatic land-cover classification using Deep Learning.

NATURAL RESOURCE MONITORING

Monitor forests, land, water, seas, and resource exploitation in real time.

DISASTER WARNING

Forecast landslides, floods, saltwater intrusion, and environmental changes using AI models.

SMART CITIES

Planning and monitoring of infrastructure, transportation, and urban development based on satellite data.

LOGISTICS & MARITIME

Optimize transport routes, track vessels, and enable smart seaport management.

HIGH-TECH AGRICULTURE

Forecast crop seasons, detect pests and diseases, and optimize irrigation using multispectral satellite imagery.

APPLICATION SERVICES & SOLUTIONS

Agriculture

Crop and seasonal monitoring

Pest, disease, and drought detection

Production optimization

Raw material area management

Logistics & Maritime

Transport route tracking

24/7 vessel monitoring

Seaport management

Maritime safety

Natural Resources & Environment

Forest, land, and marine monitoring

Climate change monitoring

Disaster prevention

Urban planning

Satellite Connectivity

Remote and underserved areas

Offshore islands

Backup infrastructure

Remote healthcare and education

Government Agencies

Land and resource management

Environmental monitoring

Infrastructure planning

Disaster warning

DIGITAL FINANCE & COMMERCIALIZATION

SATELLITE PAYMENT GATEWAY

- Payment for data, remote sensing imagery, and digital maps
- Integration with e-wallets, QR payments, and international payments
- B2B, B2G, and B2C models for satellite services
- Service package and e-invoice management

DIGITAL ASSET EXCHANGE

- Trading of legal digital and crypto assets
- Custody and customer identification (KYC)
- connecting digital assets with satellite data and AI
- Transparency standards and risk governance

DIGITAL BANKING & FINANCE

- Digital banking serving the CMC SpaceY ecosystem
- Accounts, payments, and technology credit
- Legal cross-border payments
- Financial analytics combined with space data

STRATEGIC INFRASTRUCTURE IN VIETNAM

Space technology infrastructure ecosystem - Saigon Silicon Center, Ho Chi Minh City

1

SPACE TECHNOLOGY R&D CENTER

Satellite research, simulation, AI algorithms, and institute-university cooperation

2

SATELLITE MANUFACTURING & TESTING CENTER

Satellite assembly, integration, and testing; high-tech industrial supply chain

3

OPERATIONS & DATA PROCESSING CENTER

Satellite operations, AI processing and analytics, and Vietnam's space data repository

4

SOFTWARE & DIGITAL PAYMENT CENTER

Apps, APIs, payment gateways, customer identification, and the application ecosystem

5

HUMAN RESOURCE TRAINING CENTER

Satellite engineers, AI and remote sensing specialists, software engineers, and digital finance professionals

FIVE-PHASE DEVELOPMENT ROADMAP

STRATEGIC VALUE FOR VIETNAM

ECONOMY

Form Vietnam's space economy sector. Create revenue sources from satellite data, AI, software, payments, and digital finance.

SCIENCE - TECHNOLOGY

Participate in high-tech sectors: satellites, remote sensing, AI, Big Data, platform software, and supporting industries.

SOCIETY

Connect remote and underserved areas; remote healthcare and education; disaster warning; narrow regional development gaps.

ENVIRONMENT

Monitor forests, saltwater intrusion, landslides, water resources, seas and coastal areas, and large-scale climate change.

DIGITAL TRANSFORMATION

Connect satellite data with software, apps, social networks, payment gateways, and digital banking - creating a closed-loop digital ecosystem.

POTENTIAL REVENUE MODEL

1

SATELLITE & REMOTE SENSING DATA

Satellite imagery, EO data, natural resources, urban areas, and agriculture

2

AI ANALYTICS

Analytical reports, forecasts, digital maps, and risk models

3

SATELLITE CONNECTIVITY

Remote areas, islands, maritime, logistics, and backup infrastructure

4

GOVERNMENT SERVICES

Land management, planning, disasters, and natural resources

5

PAYMENT GATEWAY & API

Payment fees, subscriptions, APIs, and enterprise packages

6

DIGITAL ASSET EXCHANGE

Transaction, listing, custody, and market data fees

7

BANKING & DIGITAL FINANCE

Payments, accounts, credit, and technology insurance

8

APPS & SOFTWARE

Subscriptions, advertising, APIs, and integrated e-commerce

9

TRAINING & CONSULTING

Human resources, space data applications, and system implementation

VISION 2045 & DEVELOPMENT COMMITMENTS

By 2045, CMC SpaceY Group JSC. will become a regional-scale space technology - data - AI - telecommunications - digital finance group, with Vietnam as the center for operations, research, and service commercialization.

VIETNAM-OWNED

100% Vietnamese ownership, strategic control and operation

LEGAL COMPLIANCE

Fully satisfy legal conditions and obtain required licenses

DATA SECURITY

Data storage and processing in accordance with Vietnamese regulations

PEACEFUL & CIVIL PURPOSES

Technology for civil purposes and sustainable development

INTERNATIONAL COOPERATION

Transparent and safe cooperation, with Vietnam retaining control

INNOVATION

Enhance endogenous capacity and technological autonomy

MULTI-ORBIT DEVELOPMENT ORIENTATION

CMC SpaceY researches, develops, and manufactures commercial satellite lines. There are currently more than 5,400 active satellites.

Classification by orbit

»  **LEO (Low Earth Orbit):** Low Earth orbit (160-1,500 km). Ideal for remote sensing, broadband internet connectivity, and maximum latency reduction

»  **MEO (Medium Earth Orbit):** Medium Earth orbit (~5,000-20,000 km). A specialized orbit commonly used for global navigation systems (GPS).

»  **GEO (Geostationary Orbit):** Geostationary orbit (~35,786 km). Satellites remain stationary relative to the ground and serve large-signal communications.

Building on Vietnam's foundation: The country has already made initial strides with small satellites (PicoDragon, NanoDragon, MicroDragon). CMC SpaceY will enhance these capabilities and move toward large-scale commercial satellite manufacturing.

SATELLITE ECOSYSTEM BY STRATEGIC APPLICATIONS

CMC SpaceY is oriented toward the commercialization of six core categories of artificial satellites:

»  **Communications Satellites:** Relay signals for broadcasting, telephone, and internet services (Vietnam's VINASAT-1 and VINASAT-2).

»  **Remote Sensing Satellites:** Observe the Earth, capture images, monitor the environment, and track natural resources (VNREDSat-1).

»  **Navigation Satellites:** Provide navigation, positioning, and real-time timing functions (such as GPS, Galileo, and GLONASS).

»  **Financial Satellites:** Ensure absolutely secure transmission lines and an independent international payment system.

»  **Military Satellites:** Serve reconnaissance, intelligence, missile warning, and national defense security purposes.

»  **Scientific Satellites:** Support space exploration, planetary observation, and the study of astronomical phenomena (such as the Hubble Space Telescope).

COVERAGE EXPANSION VISION

Plan to launch 5,000 satellites

CMC SpaceY sets the ambition to dominate cyberspace and data across Southeast Asia, Africa, and Oceania within the next five years.

Strategic roadmap to launch 5,000 low-Earth-orbit (LEO) telecommunications and remote sensing satellites.

Phase 1: Batch 1 - 250 satellites; Batch 2 - 750 satellites.

Phase 2: 1,000 satellites per year.

Total: 5,000 satellites within 5 years.

This combination will form a massive satellite constellation, ensuring the ability to provide broadband internet and 24/7 Earth resource monitoring (Earth Observation) without blind spots.

CURRENT CHALLENGES OF THE MINING INDUSTRY

Resource exploration is facing major barriers:

- » **Extremely high risk:** According to BHP statistics, out of 1,000 exploration projects, the rate of discovering a major deposit is only 0.2%.
- » **Long cycle time:** Traditional methods usually take 3 to 5 years to move from exploration to resource assessment.
- » **Depth limitations:** Current technology is often limited in its ability to accurately explore at depths below 500 meters.
- » **Enormous costs:** Blind drilling can cost hundreds of millions of USD without guaranteeing a successful outcome.

SATELLITE-BASED EXPLORATION SOLUTION

Deep Penetration Positioning Technology

CMC SpaceY applies a remote sensing satellite system combined with Artificial Intelligence (AI) to penetrate deep into areas of the Earth that older technologies cannot reach.

Its strong penetration capability enables the detection of oil, gas, and geothermal resources at depths of up to **8,000 meters**, and solid minerals and rare earth deposits at depths of up to **2,000 meters** below the surface. A breakthrough in both depth and accuracy.

DEEP COLLABORATION WITH GEOLOGICAL ORGANIZATIONS

We do not replace the traditional geology industry; rather, we create a powerful synergy with it:

- » **Space-based targeting:** CMC SpaceY satellites help narrow exploration areas from hundreds of square kilometers down to just a few dozen square meters.
- » **Ground-based partners:** Traditional geological survey companies will receive precise coordinates to carry out NMR resonance measurements and geophysical drilling in the field.
- » **Hybrid model:** This “top-down to ground” combination helps raise the success rate of deposit discovery to near certainty, while optimizing massive exploration budgets.

COMPREHENSIVE INTEGRATED SURVEY WORKFLOW

Step 1: Broad-area data acquisition: Satellites scan and capture images of the target area (without terrain limitations).

Step 2: Pre-processing & spectral filtering: Remove visible-light noise and retain the subatomic radiation signal (Microlepton).

Step 3: AI identification: Match the captured signals against the digital mineral sample library to identify material types.

Step 4: 3D modeling: Use high-performance computing (HPC) to map anomalies, depth, and the geometry of the ore body.

Step 5: Verification (NMR): Deploy ground-scanning equipment to the exact GPS coordinates to confirm the subsurface layers.

INFRASTRUCTURE STRATEGY IN VIETNAM

The main center for operations, production, and control of the entire ASEAN, Africa and Oceania network

SATELLITE R&D AND MANUFACTURING COMPLEX (35 HA)

To take over and build the project's core hub at **Saigon Hi-Tech Park**, Ho Chi Minh City (Saigon Silicon), covering an area of **35 hectares**.

SATELLITE R&D AND MANUFACTURING COMPLEX (35 HA)

Manufacturing Center: Research, assembly, and production of satellites to serve the project's internal network and support export-oriented contract manufacturing for the global market.

Big Data Center: A supercomputing server center that receives satellite signals and processes remote sensing data using AI.

Training Center: A hub for research and training of thousands of highly qualified aerospace engineers, supplying talent for Vietnam and the wider region.

DOMESTIC SPACEPORT

Saigon Atlantic Reclamation Megaproject (1,000 ha)

CMC SpaceY's long-term strategic vision includes owning an independent space launch facility in order to optimize costs and achieve full control over launch scheduling and timing.

GROUND SATELLITE LAUNCH STATION

The system will be directly linked to Vung Tau Airport to ensure strategic logistics support. This spaceport will bear primary responsibility for launching satellites in 2027.

Land reclamation will create a 100-hectare artificial island, located 3–5 km offshore, serving as the central spaceport.

ESTABLISHMENT OF AN INTERNATIONAL BRANCH NETWORK (2027)

Stepping beyond Vietnam's borders, 2027 will mark CMC SpaceY's strong presence on the global technology map:

- » **ASEAN coverage:** Simultaneous deployment of strategic branches **in Laos, Cambodia, Thailand, Indonesia, the Philippines, and Myanmar.**
- » **Expansion into Africa, Oceania:** Extending influence to countries and island nations across the **Oceania region.**
- » **Core objective:** To become the exclusive provider of satellite internet services, geospatial data, mineral exploration, and space network security solutions for governments and enterprises in these countries.

CMC SPACEY GROUP JSC.
